

ENSO

Nino-3 SST Anomalies

Observations

Control

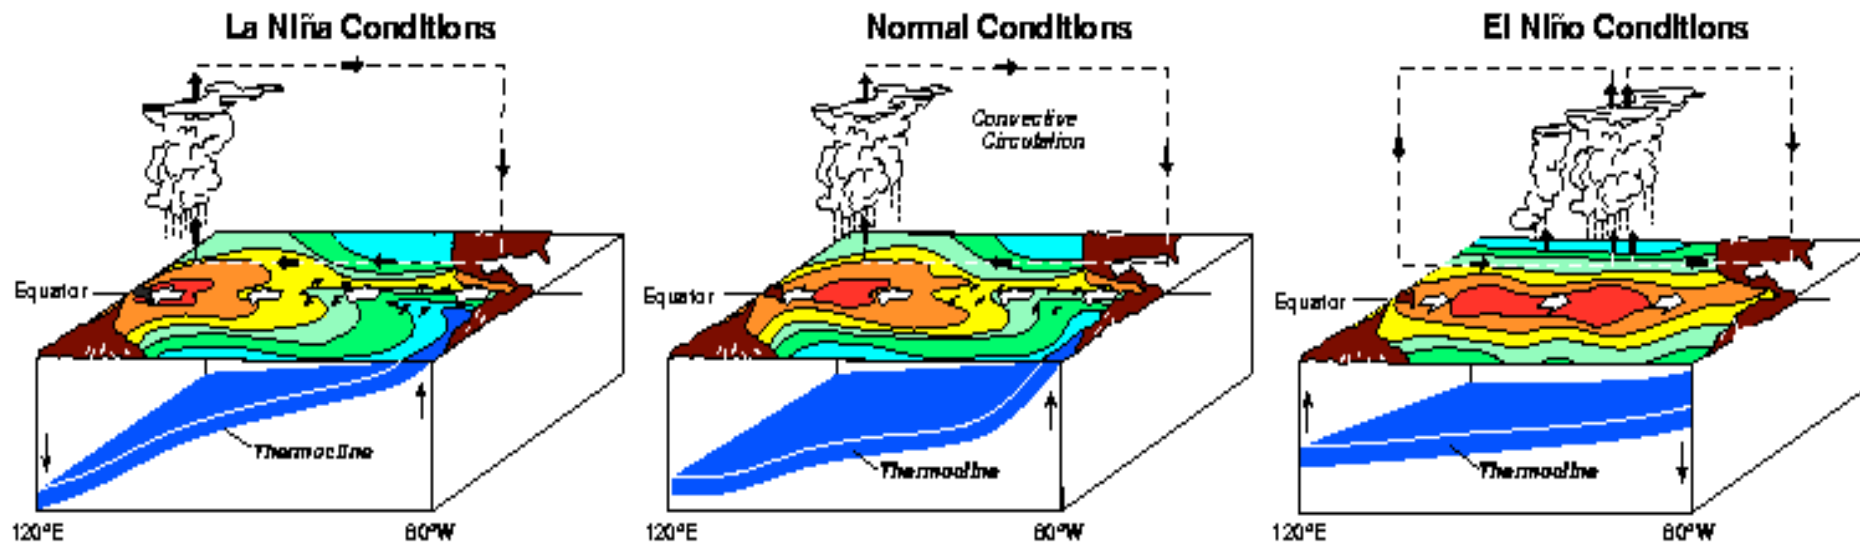

Neale-Richter

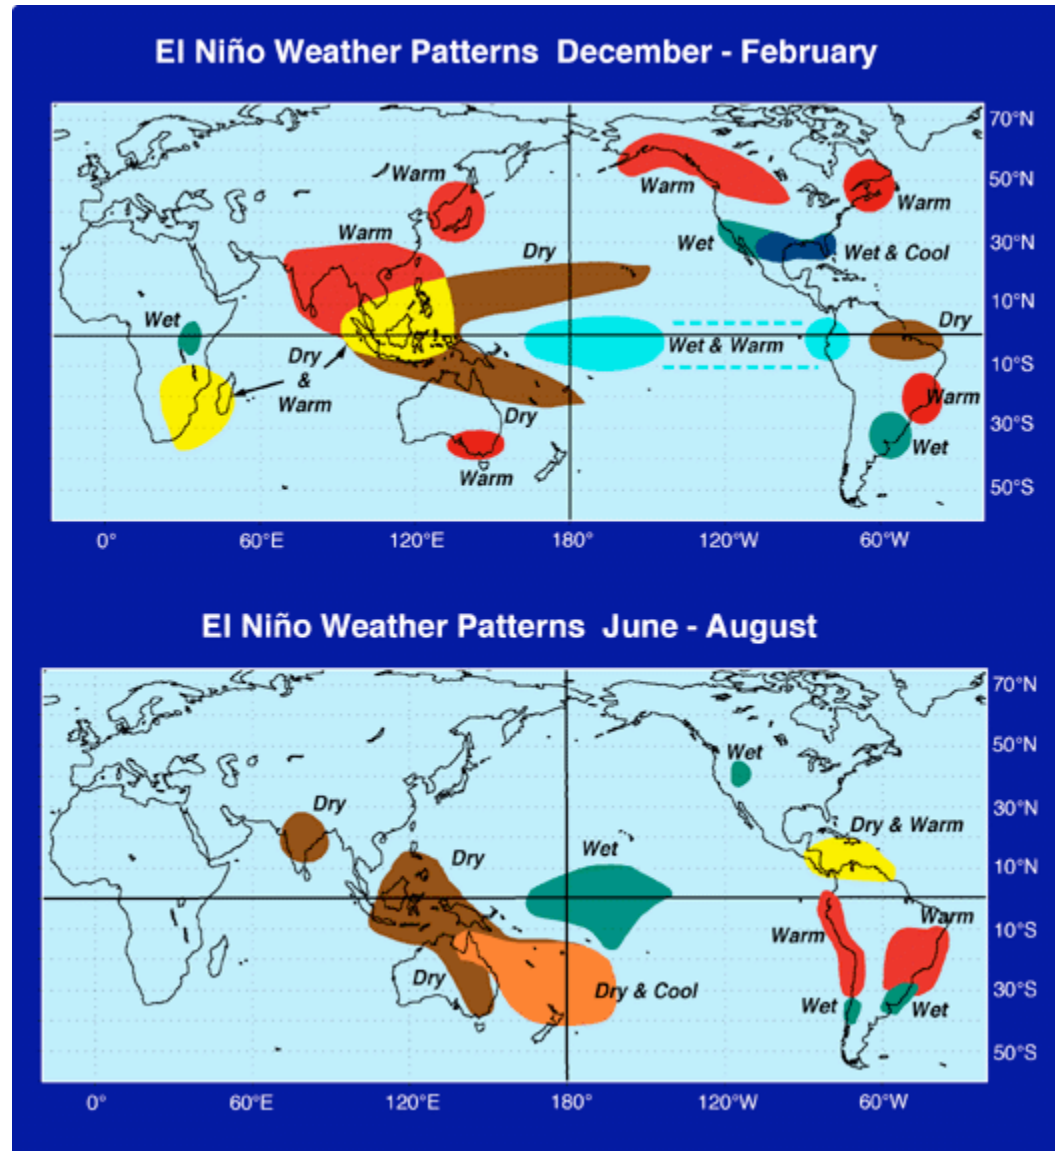

El Nino and Southern Oscillation (ENSO)

- what is ENSO?
- how does it work?
- why can't we predict it?

The three stages of ENSO

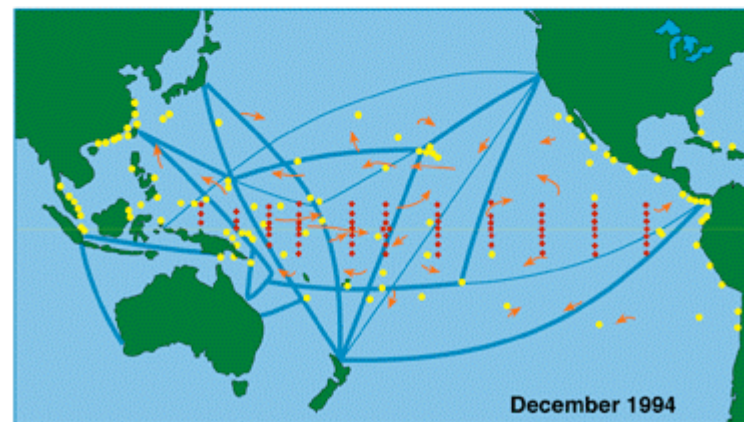

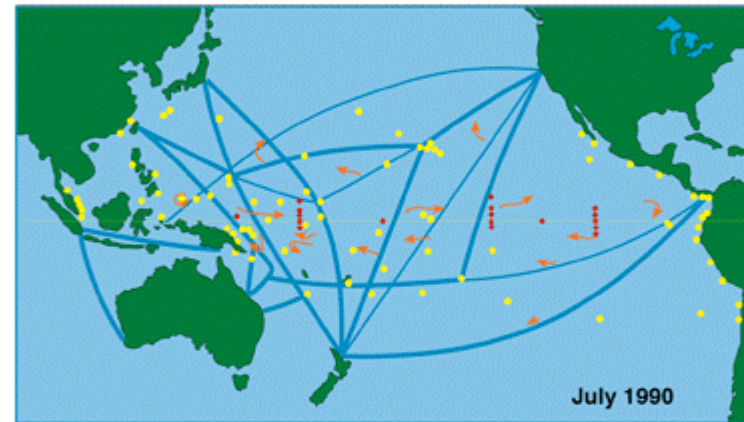

ENSO IMPACTS

The Observing Platform

TOGA in Situ Ocean Observing System
Pacific Basin

MOORING DESIGN

The Joys of Oceanography

DETAILS

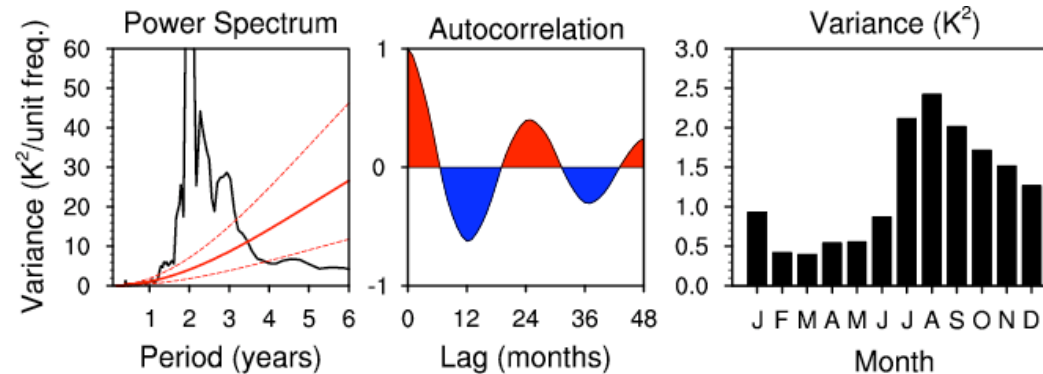

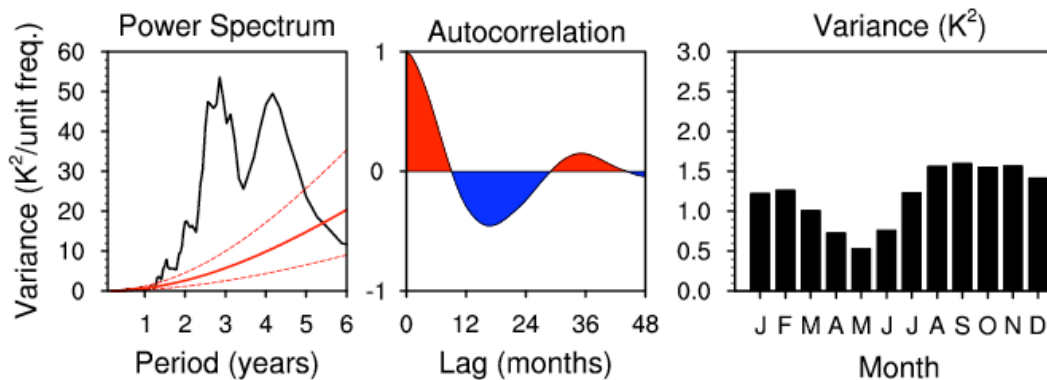

ENSO – frequency and variance

Nino-3 SST Anomalies

Observations

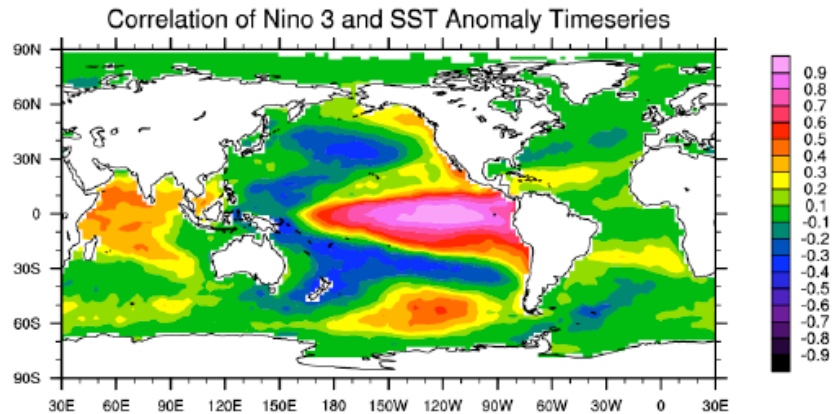

old CCSM

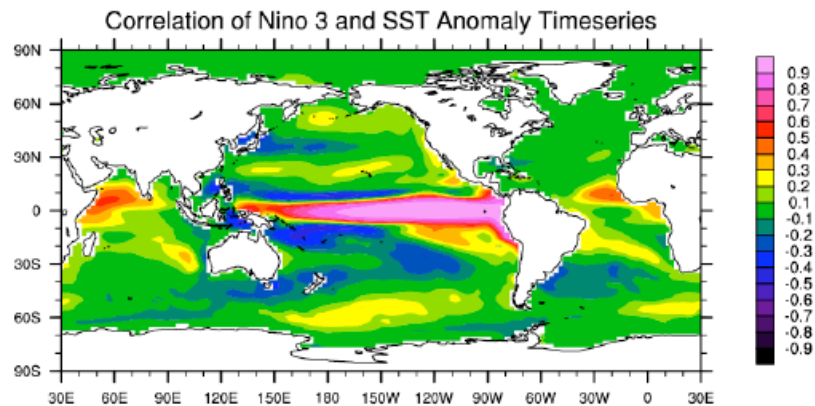

new CCSM

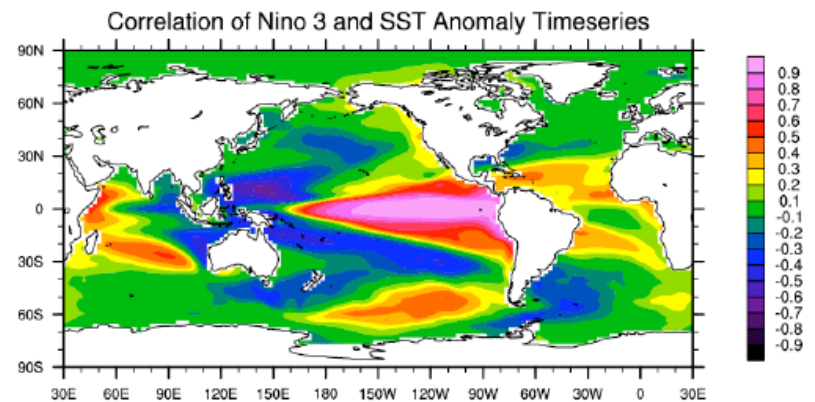

ENSO – spatial correlations

Observations

old CCSM

new CCSM

ENSO - MECHANISMS

delayed oscillator or stochastically forced?

Correlation of anomalies of tau_x and z20 with z20 at 0N/120W

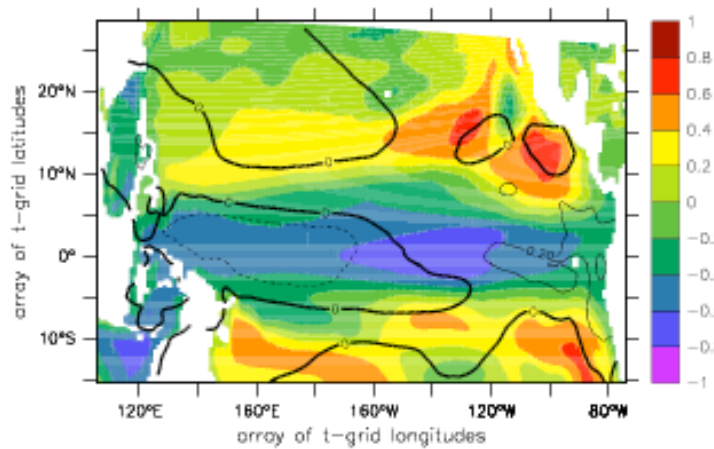

a) zero lag

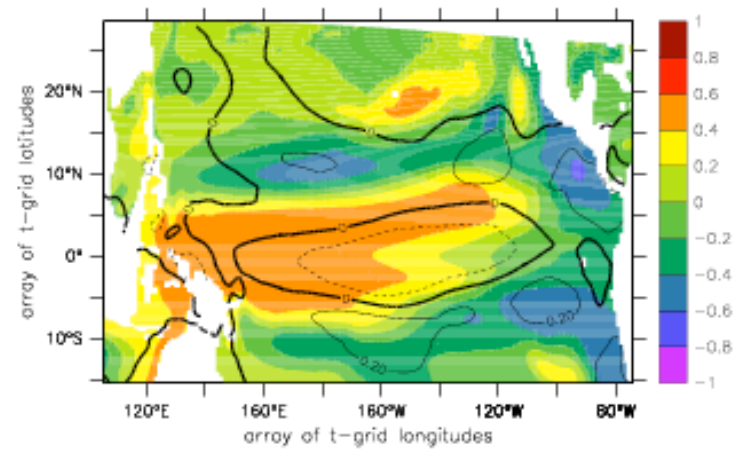

b) wind and z20 after 4 months

old CCSM

c) wind and z20 after 10 months

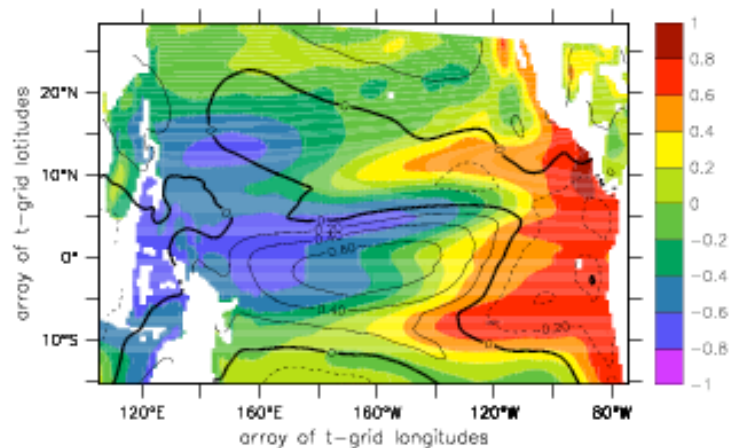

d) wind and z20 after 18 months

Correlation of anomalies of tau_x and z20 with z20 at 0N/120W

a) zero lag

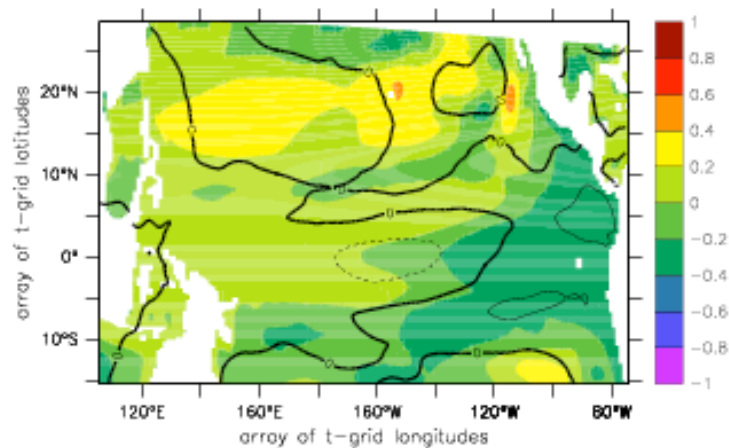

b) wind and z20 after 4 months

new CCSM

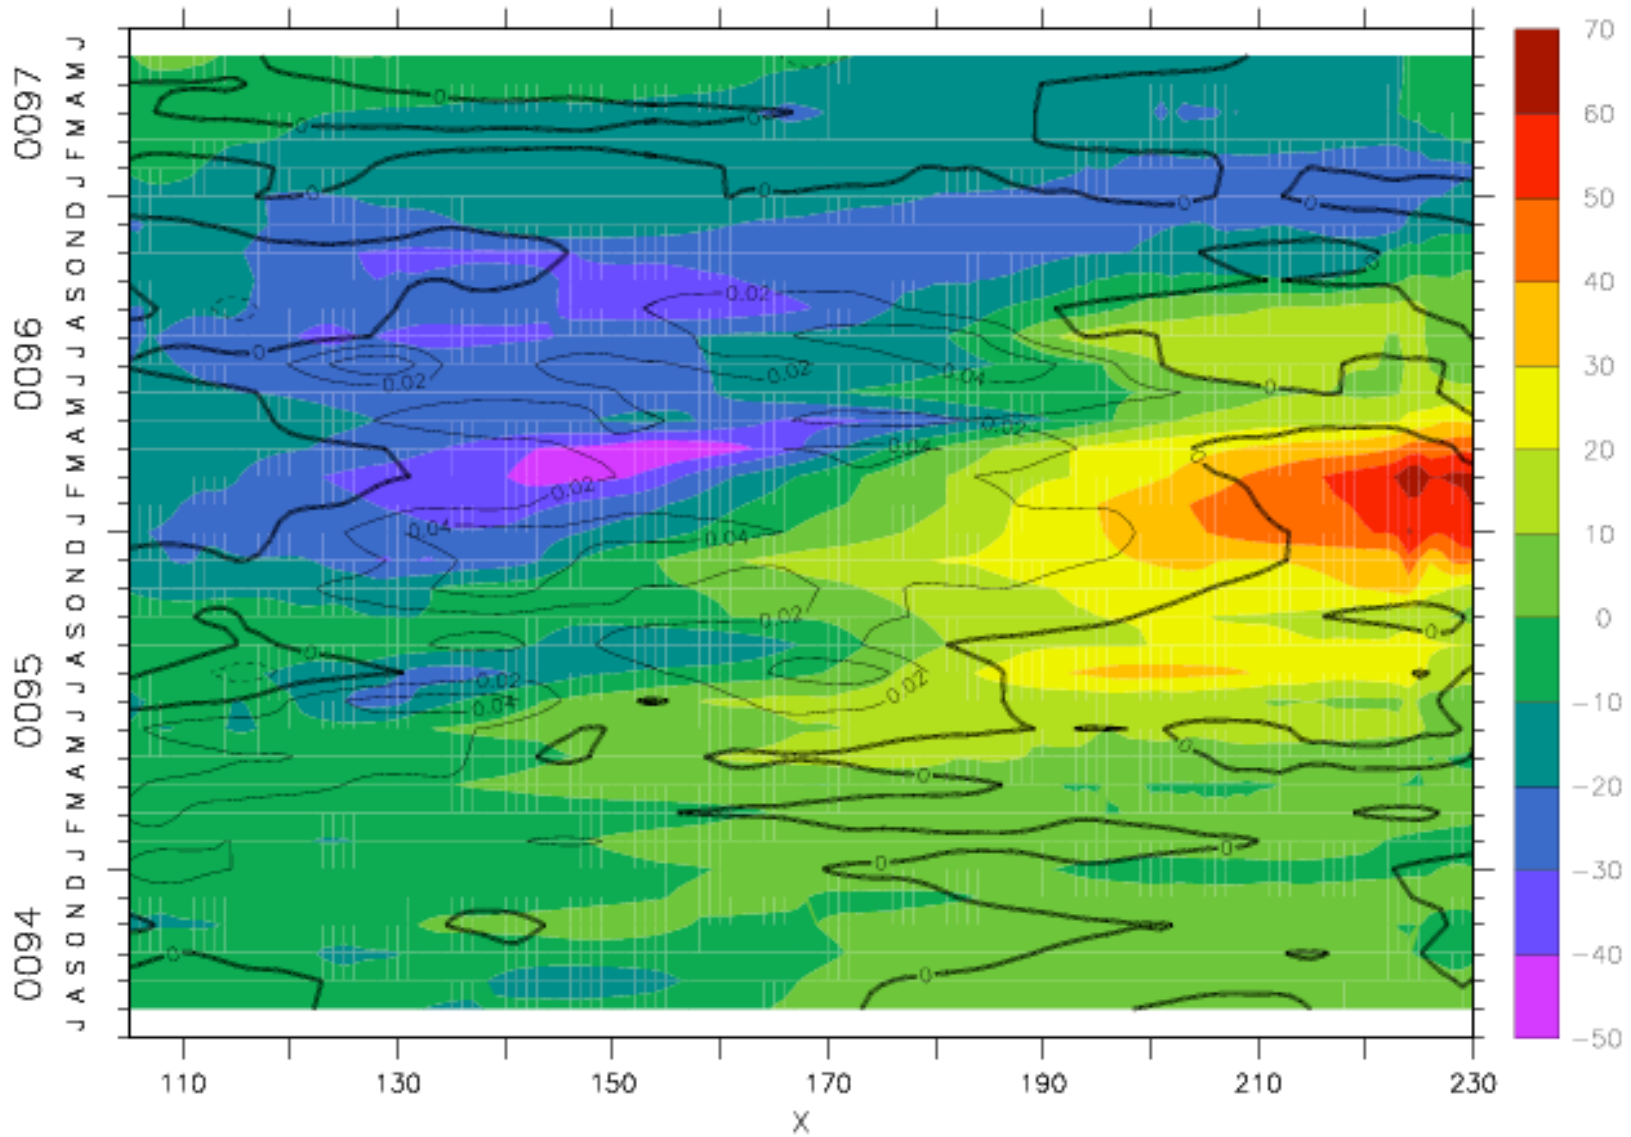

c) wind and z20 after 10 months

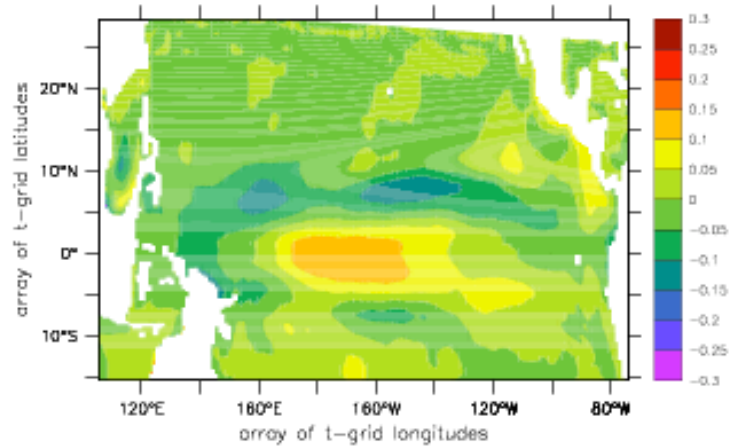

d) wind and z20 after 18 months

Hovmoeller diagram of z20 and tau_x anomaly along equator

Correlation of highpass filtered tau_x at 0N/170E with z₂₀

a) zero lag

b) 1 month lag

c) 2 months lag

d) 5 months lag

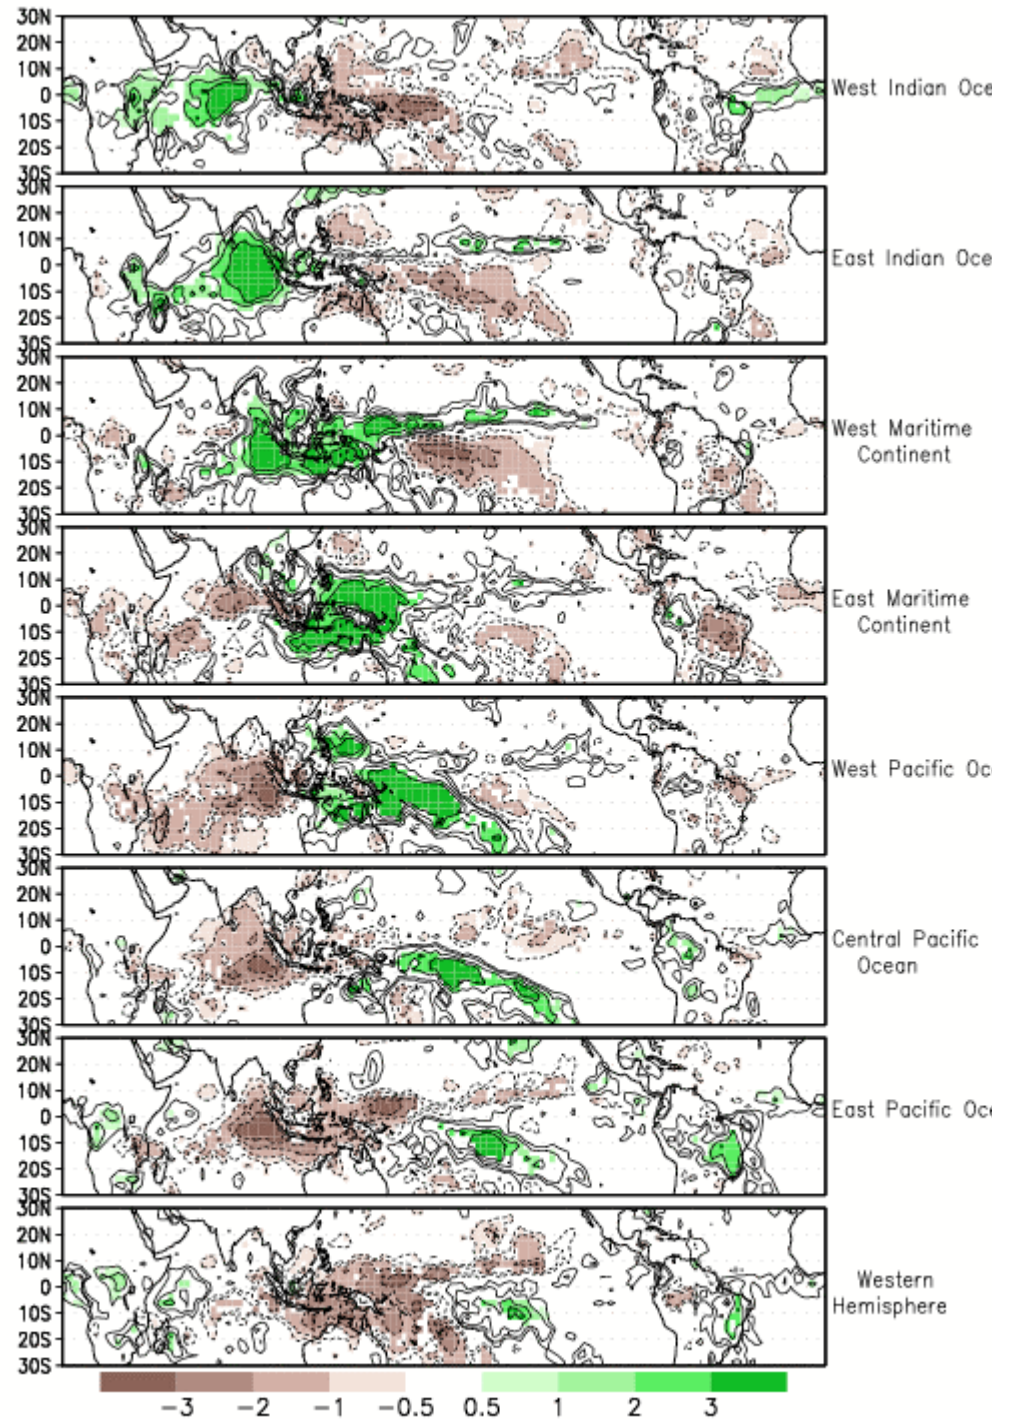

Forecasts and Noise

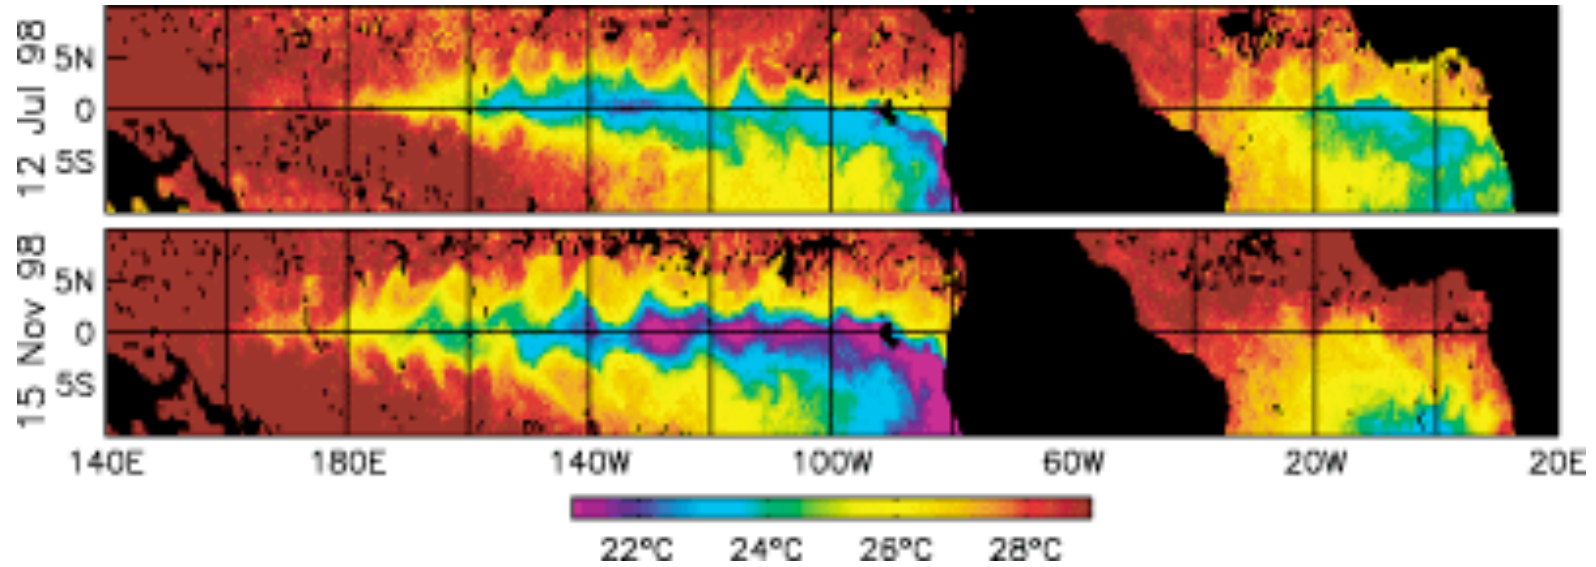

Model Forecasts of ENSO from Nov 2007

Madden-Julian Oscillation (MJO)

biweekly snapshots of rain

Tropical Instability Waves in SST

Today, you learned ...

- the tropical Pacific is the most important part of the ocean
- El Nino is triggered by westerly windbursts
- the oceanic Kelvin wave carries the signal from the western Pacific warmpool to the east
- our forecast capabilities are hindered by ocean and atmosphere weather (noise)

HOMEWORK

- go to the PMEL/TAO website
- download the temperature and fixed depth current data for 140W/0N
- make a plot of their mean and standard deviation
- plot the frequency spectrum of SST and zonal velocity at 100m depth
- state the software you used and the approximations you made
- do SST and velocity have different spectral peaks?
